Actually, the Parryville dam does not affect temperatures below. I have personally done temp studies, thinking it did. The biggest problem of the damn dam is fish movement. However, it has been pretty well established that the dam is not going anywhere. Palmerton boro profits from selling the water to Horseheads corp. The pump house behind the dam is gravity fed, and the structure is needed for this to work. LRSA has received the grant money to purchase and install a Alaskan steep ladder, but the Pfbc will not release the money.
