A few guys would complain, no doubt, but I think the impact on bass in the main Juniata would not be so bad. Raystown is only one of the three branches that feed the main J. It won't have as big of an impact on temps as it otherwise might. Currently the Raystown dam is releasing 200cfs, compared to about 300 cfs in the main Juniata at Huntingdon (above the confluence). We certainly won't lose the bass fishery...
