You can post pictures in two ways:

1. Attach it. To do this you use the full reply by hitting the blue button, rather than the quick reply box at the bottom. Then you hit the browse, and attach, before hitting submit. But you gotta shrink it way down. 250 k is the max file size. So use a program to shrink it to below that.
2. Upload it to a site like photobucket, and copy the link. Again, hit the blue reply button, and near the top there's a button that looks like a little head. Hit it, then paste the link and hit ok. Put in "L" to align it to the left, and then state how big you want it (I usually use 500).

I have my doubts whether I could tell the difference between species with spinners anyway. In duns, Limbata's are a lot lighter colored. But in spinners, they vary so much and colors of all of them overlap. I could only guess based on size and timing. Limbata's are enormous, bigger than drakes I think. But the other ones are still pretty dang big.
