10,000 seems like a lot, but is it?.

For reference purposes. My 27' round above ground pool holds about 1700 gallons. I filled it in probably about 24 hours from my well using a garden hose.

Elapsed time was closer to day and a half, but the hose was off at night.

OK, for awhile I was using two garden hoses ... until the well went dry. But for most of the time is was one standard garden hose.

One more thing to think about. The water that you drink, bathe with, flush the toilet with, or otherwise consume, where does it come from?

For most of us, it is taken from public waters only to be returned later as a warm water discharge. For those of us with wells, our water is simply taken before it reaches the public waters. But for those of us with working septic systems, we put most of it back.
