The destruction will never stop. The wells are just the first step of the network of death. All the compressors, and associated piping and stations, will be pumping toxins into the air as long as gas is being pumped all around the state. Then, add in the fact that wells get re-stimulated with more water, and you have a legacy of toxic waste for long after profitable gas is tapped. Just like coal.

We lay all these pipes through our streams, over our forests, and they are running flammable gasses 24/7. Brilliant.

Scarce resource play again. Need nuclear renaissance effective immediately. The French, who we love to mock, are going to be selling power to their European friends forever. They banned fracking, because they have nuclear power, and it reduces air pollution and provides base load power. And they will sell this power to every nation that is faltering with their wind/solar/geothermal cluster of failure. Nuclear is the least toxic, safest power we have.
