Shallow wells were never a topic of discussion. The concern is the safety and supervision when or adding dangerous ingredients to the environment without adequate control of the different forms of pollution.

Fail to see the distinction. Ingredients and chemicals are the same for shallow gas as for Marcellus. Forms of pollution also the same.

Now, if not the type, then the degree of danger, yes, is hugely different. Higher pressures = higher likelihood of failures and accidents. And should it occur, the amount of water is FAR greater, thus also more contaminants, and capability for more damage. Also, the non-accidental impacts are larger. Larger pads = more siltation, many more trucks tearing up roads, etc.
