Salmonoid:

I hope they never come up with a machine to do all that except for reasons like getting rid of the asain carp or some of the other invasive species.

(I know that when a ship is built/created/welded it has a magnetic signature. For our own stocking: If fish also have a similar magnetic signature than we have to fertilize them at the location where we want to stock them and not before then. I think that we would want the forces that draw them towards their spawning grounds to be pure. If they are fertilized elsewhere's they may be confused as to which river/lake they belong to. And thus migrating to areas that they don't belong. I know that this sounds a little deep. But it may be an answer to solving one of life's riddles (how to feed the multitudes) or the problem that is going on with removing the asain carp from our waters.)

P.S. Chaz: It's strange that I was born in Utica, NY in 1960 and now I find myself drawn to that location! It maybe more than just the Salmon River fishing!
