Jack .. just took a quick look @ the Class A list (pdf) on PAFish & Boat. Good list for me to start with but I couldn't find Class B .. am I missing something?

The wilderness trout stream listing show the biomass survey info. I'm not sure if the natural reproduction list does. I am unaware of any publicly available listing by class other than the As. What I am suggesting is that if one tributary to a larger stream is Class A, there is a likelihood that others in the vicinity are capable of good populations. You compare the topography from maps of one trib to another within the watershed and try to find similar tributaries. There is a good chance, then, that the non-Class A waters are Bs or Cs, both of which can fish well. Pick out 2-4 such waters in a limited range and go from one to the other "poking around." Spring or early Summer is the better time to do this.
