The ring is normally placed between the body of the leader and the tippet, the tag end you would tie a fly is lower down on the leader. On a 9' tapered leader, the ring is placed about 2' from the end of the tippet. I suggest you put the ring where it normally goes and rig the flies as you usually do below the ring. You could use a second tippet ring for that junction too, but I think you would lose too many of them. They're not cheap.
