They believe the bass in there now is only adults no juveniles.

This is nonsense.

Bass populations are well below historical averages in the lower Susky. Everyone who fishes the river knows this and the reason for the bass decline in that section of river has not been identified. Yes, there are lesions but they are found all through the West and North Branch where bass populations remain strong. Yes, there are lots of predatory birds - but they are up everywhere. Yes, there are pollutants from endocrine effluent and intersex characteristics.....but these too are common across all the big mid Atlantic Rivers. Something is wrong with the bass in the lower Susky. At this point, the causes are speculation. More study is needed.

With respect to juveniles: they are still there, just in depressed numbers in the lower Susky. It is hyperbole and irresponsible to assert that there are no YOY bass. This issue is studied/surveyed every year. Check out the numbers:

[Lower Susky YOY](#)
