To my mind, reintroducing waste and potentially parasites into the watershed through effluent discharge is messing with the newly established wild stock.

It seems opposition to the class A designation is just based on the potential inability to discharge effluent.

Look at the damage salmon farms have done to wild salmon and sea run brown trout runs in Scotland and Scandinavia. Diseased waste has decimated the wild stocks.

Fish farm waste or any other farm waste should not be entering out watersheds - sealed systems is the way to go & where is the hatchery going to get its water too ? From extracting and degrading the runs flows even in low summer flows ?
