well, a small update, have my home made forms all ready to drill and tap. got to my buddies, got all set up, finally put my first drill in the chuck, turn on the power... and the bit is swinging back and forth like a cows udders in the wind! google possible issues, seems the chuck heads are only pressed on, so i grab the dead blow and a punch. knock the head back off go to find a solid piece of block to re press the chuck on. and hear the machine turn on, and my buddy say " nope it's definitely the shaft that's bent!" DAMN IT! so now i wait for a new shaft to come in the mail... again the project is on pause, though i am going to start the oven project while waiting.

Well, at least you get to put off the filing for a while!

Are you going to also make a set of wooden roughing forms, or just try to get by with the metal forms?

Mike.
