Browns spawn at about 3 to 4 years of age, in Penns that means about 9 to 12 inches+ or -. What it allows is for fish that make it through the 7 to 12 inch gauntlet to keep growing. I'd like to think it will work, but I have doubts, in part because I don't think anyone has ever really studied this concept. At least PFBC is going to study it, that's a good thing.

Keeping in mind that trout have to change their diet to grow bigger than about 14 inches, I don't see it happening, I hope I'm wrong.
