I work on cars and trucks for a living and most of are work now is rust related,I cant say what it is doing to the water but i can tell in 10 years your nice truck or car is going to turn to dust and blow away,just like the bridges.

I generally keep a vehicle for a number of years. ten years is quite common for me. I have noticed in recent years that there is more corrosion damage than ten years ago. I think this is more related to cost cutting by manufacturers than anything else. Thinner plating and poor practices prior to plating.

Need to undercoat that vehicle when it is new. Clean the bottom well and put on a good coat. Best done in summer or at the dealer prior to any time on the road.
