I just started using clear cure goo and have been happy with it. I think for trout flies the CCG thin or hydro is sufficient for most uses. I have only used the thick and thin so far. I've never used any other UV cured epoxies so can't compare.

I do find the syringe a pain to use. I squeeze a little out onto a scrap rubber pad first and use a bodkin to apply it from there.

How well does the alcohol work in getting rid of the tack? I haven't tried it yet (read that it will leave a haze). I've been following up with a coat of hard as hull.

In hind sight, I would have purchased something that doesn't leave a tacky finish.
