Does anybody have any thoughts on the semi-new trend of light cured adhesives? I **use epoxy as a coating on some of my nymphs (poxyback stones, Juju Baetis, etc)**. It seems that the trend though is towards products like Clear Cure Goo, Deer Creek Resin (sic?), Loon fly finish. While these products look promising, they are also rather pricey.

My questions:

1. If you have tried them, what are your thoughts?
2. Have you noticed one is better than the others?

Any comments would be appreciated.

I currently have about 5 dozen nymphs waiting for a top coat and now would be the time to try something new.

Thanks,

T

"Epoxy" type flies for SW are one thing, but just for a coating on a nymph wing case I just use Sally Hansens Hard as Nails. Easy to use, cheap, and finishes off a nymph wing case with a hard, shiny and durable finish. HTH.
