I'd view Armstrong's book more as a catalog and a "get out and explore what's available" book, than a "go here, fish this fly, and you'll catch this many fish" book. It's a guide in the sense that it collects the information for you about limestone influenced streams, but I don't think the author would imply that his single time fishing a stream is necessarily the definitive take of the overall quality of that water.

FWIW, Canoe Creek is definitely a limestone influenced stream. There may be enough sandstone or shale beds intermingled with the limestone in the area to form "freestones" as the bedrock weathers but its definitely flowing through a limestone belt. Step into some of its tribs in the middle of summer and that should confirm it - brrrr!!
