I think it's important to learn how to tie a nail knot and that connection works very well , but i like the braided connections FoxFire is talking about , seems the braided part provides a little bungee effect . to finish those off i just use a regular old Bic lighter to shrink the tube , that stuff is called shrink tubing , make sure you work the mono/leader part the whole way up to the braided loop (Inside) till it won't go any more. By all means learn how to tie a nail knot connection but those braided connections work for me. Go easy on the heat , you don't want the shrink tubing to catch on fire , just heat till it shrinks up and holds. One bit of info that might help is always do this indoors or in the car where there is no wind. You will only make that mistake once , which is why i say it is important to learn how to tie a nail knot also. GOOD LUCK!!!!!!
