Just fixed the tip on my Renegade for the second time. It is now a 8'3" flyrod. If you go this route you do not want to apply much heat to the rod itself. Heating up the rod to much will make it brittle and thus useless. I use a glue stick designed for fishing rods.

1. Heat up the tip and pull the peices apart.
2. Check to see if the eye tip will fit the main section.
3. If eye tip will fit, you will want to heat up the glue and rub it onto the rod. (you don't need very much glue)
4. heat up glue just a little that is on the rod, and slide the Eye Tip onto it. Check to make sure all eyes line up with each other I have also used shrinktube along with the glue to better secure it.
5. If the eye tip does not fit you will have to purchase one that will.

Good luck.
