each spring may have difference resistance, but in this case likely not. you have either no resistance (both up), half resistance (one down), and full resistance (both down).

observance and experimentation will dictate the direction the pawl(s) must face in to provide more resistance in payout versus retrieve.

again, look at the bottom of the pawl, and notice the cuts are uneven. the side that has more cut off offers less resistance when its rolled that way, ergo that is the side tha tyou want to face the "back" of the reel when you retrieve.
