I've always greased my tippet with mucilin paste - right up to the fly.

It's what I was taught to do from way back

And really haven't had any problems getting takes - at least that I would blame on floating tippet, anyway.

As others have mentioned - the big thing is getting a drag free float.

As for what the trout really see - I would recommend reading "In The Ring Of The Rise" - by Vince Marinaro
