I cant find much online for leader formulas for switch rods. My rod is a Rainshadow 10'8" 7wt. and I'll mostly be using it for bass fishing on reservoirs or larger rivers. I found one formula and made some alterations so that it worked with what I actually have to work with. Tell me if this sounds like it would work for an all purpose switch rod leader.

36" 25lb / 24" 20lb / 18" 15lb / 18" 12lb/ 12" 1x / 12" 2x / 24" 3x

I'm using maxima for the first four sections and mono tippet the rest of the way out. At this point it is 12'. If I want to add 4x or 5x I can just add on from there. I just made this tonight so it hasn't been tested...just looking for opinions or other formulas.
