You know after thinking about this and the basic identity difference between brook trout (light spots on a dark background) and brown trout[EDIT] (Dark spots on a light background)[edit] its clear that the background is light and the spots are dark. I reviewed all the tiger trout pics on the site in the photo section and the vermiculations seem to lean in that direction too.

So I change my vote to weird brown spotting due to the inbreeding of hatchery fish. Also in the other thread of "ugly clarks stockers" there are clear black spots on the gill plate and red spots that do not appear on true tigers.
