Mike,

No doubt, good point made by FCP about temps and RT. But to answer your question, nearly all RT in the area around the road to nowhere bridge / lower SR section.

I surmise you are asking the question to determine if the BT survived the summer. I know you know this, but tough August into Sept for the Tully trout (see temps below). Anecdotal reports of BT sucking wind in the summer leads me to believe many of the BT didn't make it. It seems to me that RT are more tolerant of warmer water for longer periods of time. Perhaps you are considering closing down the experiment and stocking RT exclusively.
