Troutbert,

I don't think electro-shocking works as well on big water like the Yough. On section 2 for example it's nothing to observe 20-30 rising fish in easy eyesight of a wading angler on a warm summer evening, so I'm sure the electro-shocking numbers don't accurately reflect the population. On the other hand, it is a fair comparison to look at the shocking results of one year compared to another. The time trends look good in nearly all of the plots.
