So sad. Sounds like hatchery effluent is most definitely poisoning the streams. Just like the one on Big Spring until 2001. It's what happens when the agency supposedly in charge of waterways protection prioritizes their job and becomes a trout factory first and foremost regardless of the affect on the waterways they are using. I assume this is an old-school raceway-type hatchery and the periodic "flushing" of the runs flushes all the crap, quite literally, out into these precious limestone waters. Not sure what the white would be though? Perhaps a calcification or lime treatment of the effluent by the hatchery?
