after looking into this in more detail, it has done nothing but make me more confused. I have looked at several charts for rod guide spacings, and they all vary, some by 2-3 inches. I laid out the few rods I have and they are all different. 2 of the rods, both Cabellas, same length, 8 1/2, 5 & 6 wt, the guides are different. I am starting to wonder if I am putting more thought into this than is needed, or am I missing an engineering/science thing that is over my head? Are the discrepancies with the rods I own, an issue with mass production, or is there a rod weight to line to rod length to action ratio/formula I am missing? And if spacing is not spot on critical, why are the charts in 1/4 inch increments?

Any help would be greatly appreciated, thanks

Forget charts, go to a shop that carries your rod and take your rod with you, match your rod to what the manufactured rod has for guide spacing, and mark the spacing on your rod.
