... last year I took temperatures below the dam and in the more free flowing water above the impoundment. The time was late July and though I didn't write down the temperatures I believe they were the same. I was really surprised by this....

Jeff

I would bet there is permeation between the underground water and the surface water even in the "impounded" water. Plus, all the dam does is raised the water levels for a mile or two. I don't think it stops the cold water from running downhill from the cave.
