Weaves, What did the riseform look like? Sounds to me like they were porpoising to midges in the film. A size 20 Griffith's gnat dead drifted IN the film on a 6X point cast 2 feet upstream of the riser would probably work. A decent pair of compact binos will solve the riddle. Almost always, fish aren't really taking the bugs you see flying around. Hook your rod under your arm for a few minutes and watch a riser at 7X magnification then prepare to get schooled on what we should be offering the trout. JG
