A new tip section from sage is the optimal solution but how is your tip section broken? Can it be repaired? I've broken a couple rods, one a sage, and was able to insert a piece of an old rod into the hollow tube, epoxy it in place and thread wrap the joint like a guide wrap. Then epoxy the thread wraps just like your guides. Still using the rod, works well. Yours is in the tip and might need something thin and may cause a flat spot in the bend but if sage can't replace it see if someone can fix it
