For those of you that fish Clarks Creek here is some interesting Reading. Pay special attention to the fish survey and to what sections held the most fish. The fish survey was done late in the summer.

Given the relatively short survey sections electrofished, and the proximity of some of the survey sites to stocking points, I'm not sure there is a huge statistical variation in the number of salmonid species found in any particular section. However, the secret is out - the first verified publication of native salmo truttas in the North America:

p 24

*Native brown trout, pictured above, that were found during the fish survey of Clarks Creek*
