I usually stick with nymphs and emergers: Pheasant tails, caddis pupa, and some attraction patterns; emergers with bent bodies: klinkhamer and my own variations. If I do fish dries, it's usually terrestrials, mostly ants, because ants don't get the chance to fly away and the fish know this. I would fish every place you think has fish with a nymphing rig with a strike indicator- fish this time of year often take insects with very little effort.
