As I find individual streams where one species has superior residency performance vs another species, I adjust the preseason species mix accordingly. Otherwise, I generally rely on the statewide analysis...RT's reside best and grow well in the hatcheries. I then tend to stock a high percentage of RT preseason. Trying to determine why one performs better than another was in large part the focus of the original study that is available for review on the PFBC web page. I can add here that ST do not do well in rapidly flowing, relatively featureless streams or sections of streams with rapid, flume-like flow and few current breaks.
