Lower flow and freezing or near-freezing temps overnight on Friday will make water temps low on small to mid-size streams at 8AM. If fishing for stocked trout in anything but limestoners I would recommend avoiding the BT streams and fish the RT and ST streams. If you see that a stream received a mix of BT and RT from Huntsdale Hatchery you may find a higher than normal proportion of BT this year as the hatchery was a little light on RT production. Normally, a BT/RT mix preseason is about 70-90% RT.
