[Deaths per Terawatt Hour](#) for various energy sources.

I ran across something incredibly similar to these stats today, although I cannot remember where. I thought it was in the local paper, but can't find it now. In essence, the article I read today was that if you figured all the damage done to people through air pollution, the few people exposed to radiation from nuke plants pales compared to the air pollution exposure from coal. Gas is definitely cleaner than coal.
