Pennsylvanians tend to look at Ohio as being flat and uninteresting. Well, it is to large extent, but wasn't always that way. There is actually a failed rift buried under a half mile of sedimentary rock in western Ohio, There was also part of a massive mountain range in the Eastern half that has eroded away. Look up Glenville Mountains. So, there are a lot of ancient faults buried under Ohio. In SE Ohio they are buried by about 2.5 miles of sedimentary rock.

Nothing to worry about, it's just interesting if you have rocks in your head.

Here is a brief paper that I found interesting.
