the furled leaders material and construction creates a slow sinking leader with lots of drag when submerged.

Kev

isn't that drag a good thing when nymphing, i know a guy who doesn't lead his nymphs conventionally but instead holds up/back the rod to match the slower current on the bottom.

he slays them.

and i may be wrong, but i am pretty sure you could brush tungsten powder on the last foot of a furled leader and help over come the slow sink ?

this is a very interesting conversation guys, a real eye opener - Thanks, I'm going to order some blue sky leaders and give it a try !
