Hi everyone...I hope you all are preparing for another spring on the water. One of my past students is doing research at Juniata College related to fracking and small stream ecosystems. Specifically, the research team is looking at how fracking affects the most beautiful fish on the face of the planet, the brook trout. This student was exemplary in every way and he was a leader in our student sportsman's club. The least I could do was make a donation to support his efforts and spread the word to a group who probably cares more than most about the health of our streams and brook trout. Please watch the video and perhaps make a donation.

Thank you for your time and good luck on the water this spring.
