I'm not sure about in PA, but I know in a lot of areas they track the location of the drill from the surface. Drill basically on remote control, no physical connection to surface. Hole filled with drilling mud. And they determine location of the drill via vibrations in the mud. They also communicate with the drill by inducing vibrations in the mud. When you consider that drill is over 1000 feet down, around a bend, and perhaps a half mile laterally, that's just crazy amazing to me.
