What you are talking about fits the older wells where the target "pool" was not the actual shale, but an area of pervious rock holding hydrocarbons and trapped below an impervious layer. Now they are tapping directly into the shale so technically the "pool" covers multiple states. In reality though it only covers the area that they were able to crack, which apparently is still unknown.

Bottom line is that even if a horizontal well is located a mile from my property, they will likely be taking gas from under my property whether I sign a lease or not.

Fortunately, there are no plans for horizontal wells near where I live. Just vertical.
