You are correct. Should be noted that using all fissile material is not the same thing as ending up with zero radioactive waste. Not all material is fissile....

But ending up with over 1000x less, and having even what remains be far less dangerous than the status quo? Not to mention a huge source of hydrogen for a future hydrogen economy? Yeah, that's all true of Mark IV reactors. But we can't do it due to safety/environmental regs??? Ok, we'll keep our old, grandfathered plants running. Brilliant!!!

Of course, even our old plants still are far better (safer + cleaner) than any other known source of energy.
