I would try to explain that in clear water usually the bluer the water the deeper it tends to be. If the water is slightly stained not to underestimate it's depth proceed with extreme caution. And water that is deeply stained it maybe best to stay away even in familiar waterways.

It is more of a trained behavior than a 6th sense that guides you to understand water depth. Some people go through multiple soakings before they understand this. And even then, we will still challenge ourselves and our surroundings from time to time by standing on our tip -e- toes to get to a location.

Polorized glasses really make a difference in what you see and percieve.
