You can drift the area without an indicator and see how long it takes to get your nymph to the bottom, then place the indicator

I usually don't nymph with an indicator(or I'll use my leader as one), but thats not the best way to start. For example, on a run in a limestoner when you have the green tint and the surface choppiness, I can look at it usually and pretty accurately gauge the depth to start. Is that just all experience?

Thanks for all the responses.
