Also none of my 10"+ brookies took dry flies. I'm sure they do in some cases but it's much easier to get them subsurface, since they tend to be living in the deepest pools on the stream.

I agree. It is certainly possible to catch the large ones on top, but this one and others like it I have caught, were taken on big streamers and mousies. The one pictured took a sz 4 conehead bugger. It also came from the largest pool on the creek.
