I'm pretty sure most tying thread is waxed. Not for the purpose of making a fly waterproof though. It helps your materials especially dubbing, adhere to the thread.

You are fine using UniThread for your dry flies. 6/0 will handle most sizes. May want to add some spools of 8/0 for smaller flies.

If you already have grey thread you are good to go for most dries. Add tan, brown, olive and yellow/cream and you should be set for 90+% of the dry flies you'll tie for PA trout.
