Stream bed residue--Kettle Creek tributaries

While turkey hunting last week I came across white residue on the rocks of two "dry hollow" tribs in the Kettle Creek drainage. I've hiked these hollows for decades and this is a first. These hollows run during spring run-off, but are otherwise dry save the occasional spring seep. I have rock samples, still pictures, and video. Attached is one of the stills. I don't know who to approach with my data and questions. Ideas and/or advice?
