V = variation in color of fly vs. surrounding environs..

I was hugely disappointed last summer when I was backpacking and left my site in the morning, and I sensed a loss. I was a few hundred steps down the trail when I realized that my deer hair mouse was no longer on my fly pad (AKA rubber zipper pull). I went back to the campsite and after about five minutes of searching over what could have been no more than 16 square feet, I discovered the mouse. Maybe easy enough to see in the picture, but I initially could not locate it that day.
