The project will go to the firm with the lowest bid. That is how the game works. There are good firms in PA. No need to hire a company from Montana to do the work.

Any engineering company that designs this project will be required to perform hydraulic and hydrologic modeling analysis on the watershed. These models determine the existing and proposed floodplain areas and the flows during the flood event stages of 50 and 100 year intervals. Any dam, bridge or culvert work on a stream would require this modeling.

The substrate restoration can refer to the establishment of wetland areas that allow for the water to naturally permeate the soil rather than flow off.
