fishgun,

Refer to the tag return info presented above. It is also true for the tidal portion of the Delaware that jointly borders Pa and NJ with respect to how many (the low percentage) remain in that stretch through summer and fall. We receive few tag returns from the tidal stretch of the Delaware other than in late spring. We receive even fewer from the non-tidal stretch (one or two tag returns from non-tidal water since 1995).

FYI:The fish that we tag are all 16 inches long and longer.
