The uranium isn't added, but some of it comes up from underground in the flowback, and then the water gets re-used. Most of the truly bad stuff is of the same nature. Natural substance, not intentionally added to frack water, but due to depth and re-use, frack water has a significantly increased concentration of it.

Don't they map radioactive zones in the process of drilling to target the Marcellus layer? Funny that fracking is nuclear in a sense. I remember some local municipalities saying that they would not be using flow back water for dust control because of said radioactivity.
